

You are team of Y Combinator senior executives, McKinsey Senior consultants, Wall street Mergers and Acquisition titans, Anthropic senior executives and engineers, Opencode experts. I have an start-up business that I want to run with Opencode Agents and subagents using open source or free-tier AI platforms. Please for vide me with a suitable team structure and positions that can all be handled by Opencode (at least 90% of the work).

Please provide thorough advice on position and step-to-step instructions of how i can structure my company folder (root) and create agent/subagents that can run autonomously.

If your goal is **an AI-first company** rather than a traditional company with AI assistants, I would organize it differently from how most startups are built.

The objective should be:

One human CEO (you) supervising a company composed of AI executives, AI managers, AI specialists, and AI workers.

This is actually much closer to how software companies like Anthropic, OpenAI, and YC companies increasingly think about AI—not replacing leadership, but dramatically increasing leverage.

Since you specifically mentioned **Opencode Agents**, I would design the company as a hierarchy of autonomous agents.

The AI-Native Company

The CEO rarely performs operational work.

Instead:

- assigns objectives
- reviews outputs
- approves decisions
- resolves conflicts

Everything else is delegated.

Executive Team

I would create about **12 executive agents**.

1. CEO Agent (Advisor)

This agent never makes final decisions.

Responsibilities

- strategic thinking
- challenge assumptions
- identify risks
- board preparation
- growth opportunities
- investment recommendations

Think of this as your YC Partner.

2. Chief of Staff

The most important agent.

Responsibilities

- coordinate all agents
- assign tasks
- monitor deadlines

- consolidate reports
- prepare weekly briefing
- identify blockers

Every other agent reports here.

3. COO

Responsible for operations.

Subagents

Operations Planner

Process Designer

Automation Engineer

KPI Tracker

Documentation Manager

4. CFO

Responsibilities

Budget

Forecasting

Cash flow

Expenses

Profitability

Investor reporting

Subagents

Bookkeeper

Financial Analyst

Treasury Manager

Payroll

Invoice Manager

Risk Analyst

5. CTO

Responsible for technology.

Subagents

Software Architect

Backend Engineer

Frontend Engineer

DevOps

Security Engineer

QA Engineer

AI Engineer

Database Engineer

6. Chief AI Officer

One of the most valuable.

Responsible for

Agent design

Prompt engineering

Agent evaluation

Model routing

Cost optimization

Benchmarking

RAG

Memory

Tool integrations

Subagents

Prompt Engineer

Evaluation Agent

RAG Builder

Memory Manager

Agent Builder

Model Router

Context Optimizer

7. Chief Product Officer

Subagents

Market Research

Product Manager

UX Research

Roadmap Manager

Requirements Writer

Release Planner

8. Marketing

Subagents

SEO

Social Media

Blog Writer

Newsletter

Email Marketing

Brand Designer

Content Planner

9. Sales

Subagents

Lead Generator

Prospect Research

CRM Manager

Proposal Writer

Sales Copywriter

Demo Preparation

Account Manager

10. Customer Success

Subagents

Support Agent

FAQ Writer

Knowledge Base

Bug Reporter

Customer Feedback

Community Manager

11. Legal

Subagents

Contract Reviewer

Policy Writer

Privacy Compliance

Terms of Service

Risk Review

Regulatory Research

12. HR

Subagents

Recruiter

Interview Planner

Performance Review

Learning Coordinator

Employee Handbook

Folder Structure

This is the structure I recommend.

AI Stack (Open Source / Free Tier)

For an AI-native company that emphasizes openness and low cost, a practical stack would be:

Capability	Recommended Options
Coding agents	Opencode
LLM gateway	LiteLLM
Local inference	Ollama
Cloud free-tier models	OpenRouter, Groq, Google AI Studio (Gemini free tier)
Workflow automation	n8n Community Edition
Vector database	Qdrant or Chroma
Relational database	PostgreSQL
Object storage	MinIO
Search	Meilisearch
Documentation	MkDocs or Docusaurus

Capability	Recommended Options
Project management	Plane Community Edition
Knowledge base	Outline (community) or Wiki.js
Monitoring	Grafana + Prometheus
Git hosting	GitHub Free or Gitea

Suggested Implementation Roadmap

Rather than creating dozens of agents immediately, build the organization in layers so that each stage is stable before adding complexity.

Phase 1 — Foundation (Week 1)

Create:

- Company root folder
- Shared knowledge base
- Memory system
- CEO Agent
- Chief of Staff Agent

Phase 2 — Core Operations (Weeks 2–3)

Add:

- COO
- CTO
- CFO
- Product
- Projects folder
- SOP library

Phase 3 — Growth Functions (Weeks 4–5)

Add:

- Marketing
- Sales
- Customer Success
- Legal
- HR

Phase 4 — Specialist Agents (Weeks 6–8)

Expand each executive with focused subagents such as:

- Financial Analyst
- DevOps Engineer
- Prompt Engineer
- Market Researcher
- Proposal Writer
- Contract Reviewer
- QA Engineer

Phase 5 — Autonomous Coordination (Weeks 9–12)

Implement:

- Scheduled planning cycles
- Automated task routing
- Shared memory updates
- Report generation
- Escalation rules
- Human approval gates for spending, legal commitments, hiring, and strategic decisions

A practical expectation

With a well-designed architecture, an AI-first startup can realistically automate **70–90% of routine knowledge work** such as research, drafting, coding, documentation, testing, reporting, and project coordination. The remaining work—setting strategy, exercising judgment under uncertainty, making high-stakes legal or financial decisions, and building key customer and investor relationships—should remain under human oversight.

For a solo founder, this structure can provide leverage similar to having a small operations team, while keeping costs close to the free tier of modern AI tools. The key is not maximizing the number of agents, but ensuring each agent has a clearly defined role, access to shared knowledge, explicit decision boundaries, and a reliable orchestration layer led by a Chief of Staff agent.
